1 Overview

2 Architecture

3 User interfaces overview

4 DQM4HEP tests

Overview

DQM4HEP : an online monitoring system for data quality

Key points

- Event distributed system : server/client paradigm
- Set of interfaces for data analysis, adapted to DQM purpose
- Histogram distributed system
- Visualization interface (Qt GUI)
- Large scale process management
- IO support for any data type (opt. LCIO)
- ELog interface

Set of interfaces inspired from CMS DQM system (monitor elements, collectors).

Application flow inspired from ALICE DQM system, AMORE (cycles).

Overview

DQM4HEP packages

One location : <https://github.com/DQM4HEP>

The main package : DQM4HEP

Installation package for sub-packages (CMake).

Sub-packages :

- **dim** : Distributed Information Management (Delphi). Manage client/server communications
- **dimjc** : DIM Job Control (L. Mirabito). Process management using dim.
- **jsoncpp** : Json I/O for dimjc
- **streamlog** : logging library (used in ILCSoft)
- **DQMCore** : Core part of the DQM system. Client/server interfaces, analysis, IO, run control interface, plugin management ...
- **DQMVis** : Qt visualization interfaces. Job control gui client, monitoring gui client, run control server gui (standalone).
- **LCIO** : Linear Collider IO. Build support for LCIO streamer

Overview

Installation

Installation mode

Designed to be built **standalone** or using **ILCSOFT**.

Basic install requires ROOT.

Full install with DQMVis requires Qt and ROOT **compiled with *–enable-qt* option**.

Standalone mode :

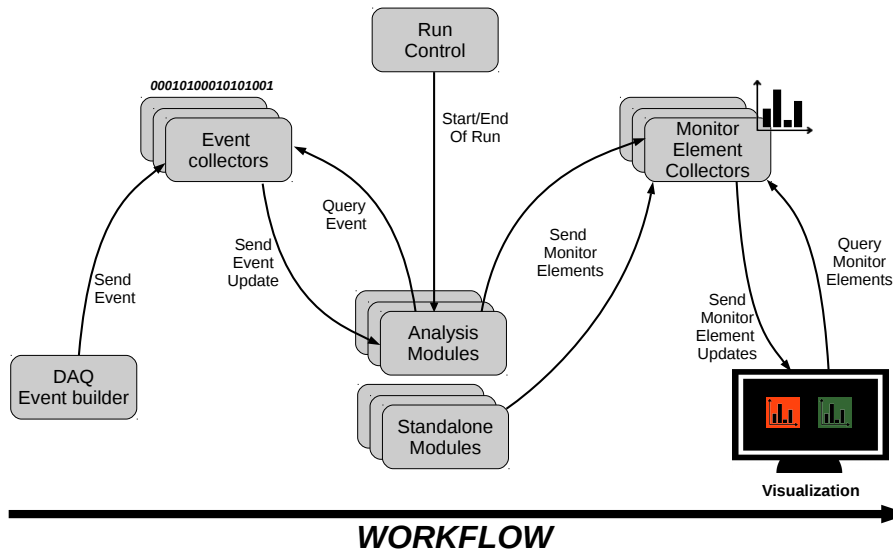

- Basic install : dim, dimjc, jsoncpp, streamlog, DQMCORE
- Full install : + DQMVis, LCIO

ILCSOFT mode :

- Basic install : dim, dimjc, jsoncpp, DQMCORE
- Full install : + DQMVis

Architecture

Global workflow

Architecture

Event collectors, client/server

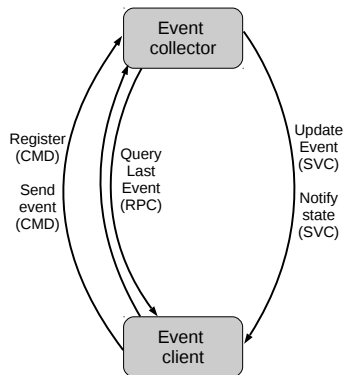

Event collector (`DQMEventCollector`) and
Event client (`DQMEventClient`)
linked via DIM (TPC/IP).

Receiver interface with 2 modes :

- on update
- on query

Sender interface with one unique command to send an
event to the collector server

Use `dqm4hep_start_event_collector` to start a
collector server.

Architecture

Module applications - analysis module

Purpose

- Receive events from a collector server and process them
 - Produce monitor elements (histograms, scalars, generic TObject)
 - Follow the run control signals (SOR, EOR)
-
- **Init** : Initialize the application : load dlls, declare services, etc ... Wait for a SOR
 - **Start of run** : start cycles loop, open archive
 - **Start of cycle** : start a cycle of *'process event'*
 - **Process event** : Process incoming event, fill monitor elements, etc ...
 - **End of cycle** : send subscribed monitor elements, update archive (opt).
 - **End of run** : Wait for SOR, close archive (opt).
 - **End** : Clean and exit module.

To implement online DQM analysis, user must implement the `DQMAnalysisModule` interface. A shared library must be build and loaded in the application using the plugin system (see next slides).

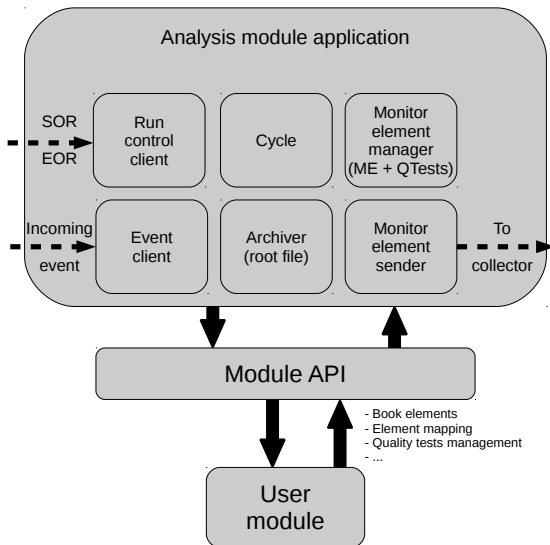

Use `dqm4hep_start_analysis_module` to start an analysis module.

Analysis module
application flow

Architecture

Module API

Architecture

Module applications - standalone module

Purpose

- No event reception
- No run signals
- Produce monitor elements (histograms, scalars, generic TObject)

- **Init** : Load dlls, init the module.
- **Start of cycle** : start a timer cycle of n seconds
- **Process** : call back function.
- **End of cycle** : collect monitor elements and send
- **End** : The application has received a signal to exit and the process ends.

To implement online standalone analysis, user must implement the `DQMStandaloneModule` interface. A shared library must be build and loaded in the application using the plugin system (see next slides).

Designed for *slow control* - like data processing.

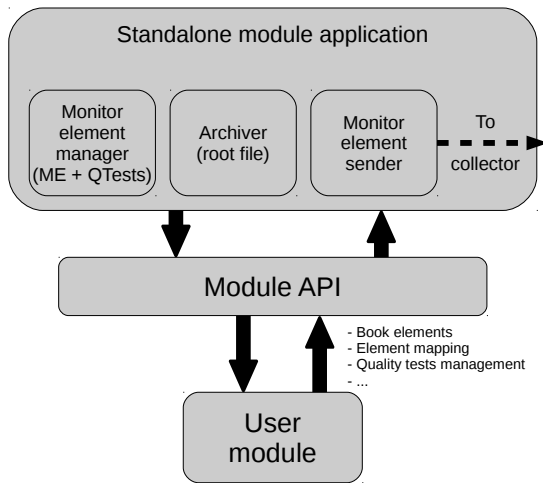

Use `dqm4hep_start_standalone_module` to start a standalone module.

Standalone module application flow

Architecture

Module API

Architecture

Monitor element collector, client/server

Collect monitor elements from different modules.

Publish/subscribe paradigm with client side.

Collector stores the available list of elements (names) from the different modules and the elements that the clients have subscribed.

Client interface works on both update and query modes.

Use `dqm4hep_start_monitor_element_collector` monitor element collector.

User interfaces overview

Plugin system

The core part of the system provides a plugin system, massively used by the framework to handle user classes.

The `DQMPluginManager` singleton class manages the plug-ins provided by the system and the users. Plugins can be loaded at any time by loading shared libraries.

Example :

```
// single library loading
DQMPluginManager::instance()->loadLibrary("libMyClass.so");
// multiple libraries loading
StringVector libraries = { "libMyClass.so" , "libAnotherClass.so" }
DQMPluginManager::instance()->loadLibraries(libraries);
// using DQM4HEP_PLUGIN_DLL env var with ':' separation
// assuming export DQM4HEP_PLUGIN_DLL=./lib/libSuperClass.so : ./lib/libDirtyClass.so
DQMPluginManager::instance()->loadLibraries();
```

In principle **any** user class can be plugged in the framework and retrieved inside applications.

User interfaces overview

Plugin system

User Example :

```
// MyClass.h
class MyClass
{
    public:
        MyClass(); // Default constructor mandatory !!
    private:
        int    m_attribute;
};
// MyClass.cc
DQM_PLUGIN_DECL( MyClass , "MyClass" ) // plug the class in the system

MyClass::MyClass() : m_attribute(0) {}
// ...
```

To get an instance of your class, use the plugin manager :

```
// ...
MyClass *pClass = DQMPluginManager::instance()->createPluginClass<MyClass>("MyClass");
// ...
```

For example, this functionality is used internally to get :

- user module implementations
- event streamers
- run control clients

User interfaces overview

Streaming interface

The framework has **no dependency on the type of data** transferred over the network !

For example, the streamer for LCIO is implemented and provided as a plug-in in the software. The type of data that is transferred over the network can be user defined.

Users have to implements the `DQMEventStreamer` interface :

```
class DQMEventStreamer : public DQMStreamer<DQMEvent>
{
public:
    // ...
    virtual StatusCode serialize(const DQMEvent *const pEvent, DQMDataStream *const pDataStream) = 0;
    virtual StatusCode deserialize(DQMEvent *&pEvent, DQMDataStream *const pDataStream) = 0;
    virtual StatusCode serialize(const DQMEvent *const pEvent, const std::string &subEventIdentifier,
                                DQMDataStream *const pDataStream) = 0;
};
```

and plug the streamer class using the plugin mechanism. The `DQMDataStream` class provides functions to read and write raw buffers.

For an experiment with a simple event structure, it can be useful to define a raw event streamer and propagate the event through the DQM system without taking care about the network interface.

User interfaces overview

Gui visualisation

Gui interfaces for DQM client developed :

- Run control, job control, online monitoring
- Written with Qt4 framework 
- Easily configurable with json and xml.

User interfaces overview

Run Control GUI

The screenshot displays the 'Run control (DQMRunControl)' window. It features a 'Run Info' section with a 'Run number' field set to 1 and a 'Run description' text area containing 'A Short Run Description'. Below this is a 'Run Parameters' table with two entries: 'Energy (GeV)' with a value of 10, and 'Beam' with a value of 'P+'. There are 'Add Parameter' and 'Delete Parameter' buttons. The 'Detector name' field is set to 'ADetectorName'. At the bottom of the 'Run Info' section are 'Start run' and 'End run' buttons. The 'Run status' section shows 'Run number 1' in 'STOPPED_STATE', with 'Started at 11h 18m 56s' and 'Ended at 11h 19m 27s'. The 'Logging' section contains three messages: 'Starting run control service DQMRunControl', 'Starting new run no 1', and 'Stopping current run'.

DQM4HEP tests

Tests of the framework were performed using the SDHCAL electronics (SDHCAL Difs).

Ideas were to test :

- Easy to deploy ? configure ?
- Easy to use interfaces ?
- Network saturation with many analysis
- Test specific SDHCAL DQM tools :
 - Raw data converter service (Streamout)
 - Event reconstruction tool (Trivent)
 - Online analysis
 - Online data taking (/dev/shm reader)

DQM4HEP tests

Deployment

figs/DQM4HEP_DEPLOYEMENT_TEST.pdf

DQM4HEP tests

Results

- Easy package installation/update (CMake + GIT)
- Input file : SDHCAL TB December 726280 (20 GeV pion run)

- Job control really makes life easier !

Easy to start, stop, restart and reconfigure programs. Easy to detect configuration problems !

Gui can display :

- total efficiency mapping (47 plots)
- total multiplicity mapping (47 plots)
- global efficiency/multiplicity and statistics (4 plots)

at the same time, with frequent updates (every 5 seconds) without lagging. Gui handling still ok.

figs/AsicEff42.png

Disconnected DIF in layer 42 !

More tests :

DQM4HEP tests

Conclusions and plans

Conclusion

- Network decouples/links different part of the system.
- Plugins (modules, data streaming) to configure and run the system
- Tools for data feed in the system from the DAQ (event client interface)
- GUIs to control/monitor the system
- Tests OK, numbers ... ?

Plans

- Full implementation of SDHCAL DQM :
 - Gas system, HV, LV, T/P
 - Global detector (efficiency, multiplicity, nHit 1-2-3, rate)
 - Particle ID (counting, selection)
 - Particle specific modules (pion, electron, muons)
 - Energy reconstruction
 - Particle flow (performance)
- Performance tests : timing, statistics, compression (network, streaming)
- Reimplementation of some interfaces (networking)
- ILCSoft ?
- Combined ECAL test-beam : combined DQM ?

Thanks for your attention
